

Prior weight 0.20

- prior $N(0.5, 0.3^2)$
- - - likelihood: $\hat{\beta} = 0.9, s = 0.15$
- posterior $N(0.82, 0.134^2)$

Empirical Bayes

- $\ln p(\hat{\beta} \mid \tau^2), \hat{\beta} \sim N(0, \tau^2 + s^2)$
- - - maximum $\hat{\tau}^2 = \hat{\beta}^2 - s^2 = 0.79$
